Current Status

The Slovak Republic has transposed the EP and Council Directive 2009/28/EC of 23 April 2009 (on the promotion of renewable energy sources and amending the subsequent repealing Directives 2001/77/EC and 2003/30/EC) and the EP and Council Directive no. 2009/30/EC of 23 April 2009 (amending Council Directive 98/70/EC as regards the quality of gasoline, diesel and gas-oil and introducing a mechanism to monitor and reduce greenhouse gas emissions and amending Council Directive 1999/32 / EC, as regards the quality of fuel used by inland waterway vessels and repealing Directive 93/12/EEC) through Act no. 136/2011 of 5 April 2011, which amends Act no. 309/2009 Z. z. the promotion of renewable energy sources and high efficiency cogeneration and amending certain laws and amending the Act. 276/2001 Z. z. on regulation in network industries and amending certain laws as amended. The Act came into force on 1 May 2011. Amendment to the Act addresses the basic roles and responsibilities of competent authorities and economic operators in relation to demonstrating compliance with the sustainability criteria for biofuels production and bioliquids. Details of related measures will be resolved by the implementing regulation issued by the Ministry of the Environment.

Minister of Environment on 26 November 2010 ruled that the certification authority for verification of certificates of origin or biofuel bioliquids the Slovak Hydrometeorological Institute. Ministry of Environment will be the effective date of regulations implementing the Act. 309/2009 Z. z. recognize other qualified persons who are responsible for verifying certificates.

On 1 entered into force in September 2011 Ministry of Environment of the Slovak Republic. 271/2011 Z. Laws establishing sustainability criteria and targets for reducing greenhouse gas emissions from fuels. The Decree deals with the details of proving compliance with the sustainability criteria for biofuels and bioliquids. To calculate greenhouse gas emissions throughout the life cycle of biofuels or bioliquids can use the calculation program available at www.biograce.net

Up

Contents

1. Renewable Energy Directive
2. Project BioGrace
3. BioGrace as voluntary scheme
4. GHG Excel tool – incl. the calculation example
5. GHG Excel tool – additional items
6. Conclusion

Renewable Energy Directive (RED)

Art 17: Sustainability criteria for biofuels

- Minimum GHG emission savings (17.2)
 - 35%, 50% (2017), 60% (2018)

Art 19: Calculation of the greenhouse gas impact

- Economic operators may use
 - default values (19.1.a)
 - actual values calculated according to Annex V.C (19.1.b)
 - sum of actual value and disaggregated default value (19.1.c)

Art 18: Verification of compliance with the sustainability criteria

- Independent auditors must check information (18.3)
- Can be part of voluntary certification schemes (18.4)

RED Annex V.a

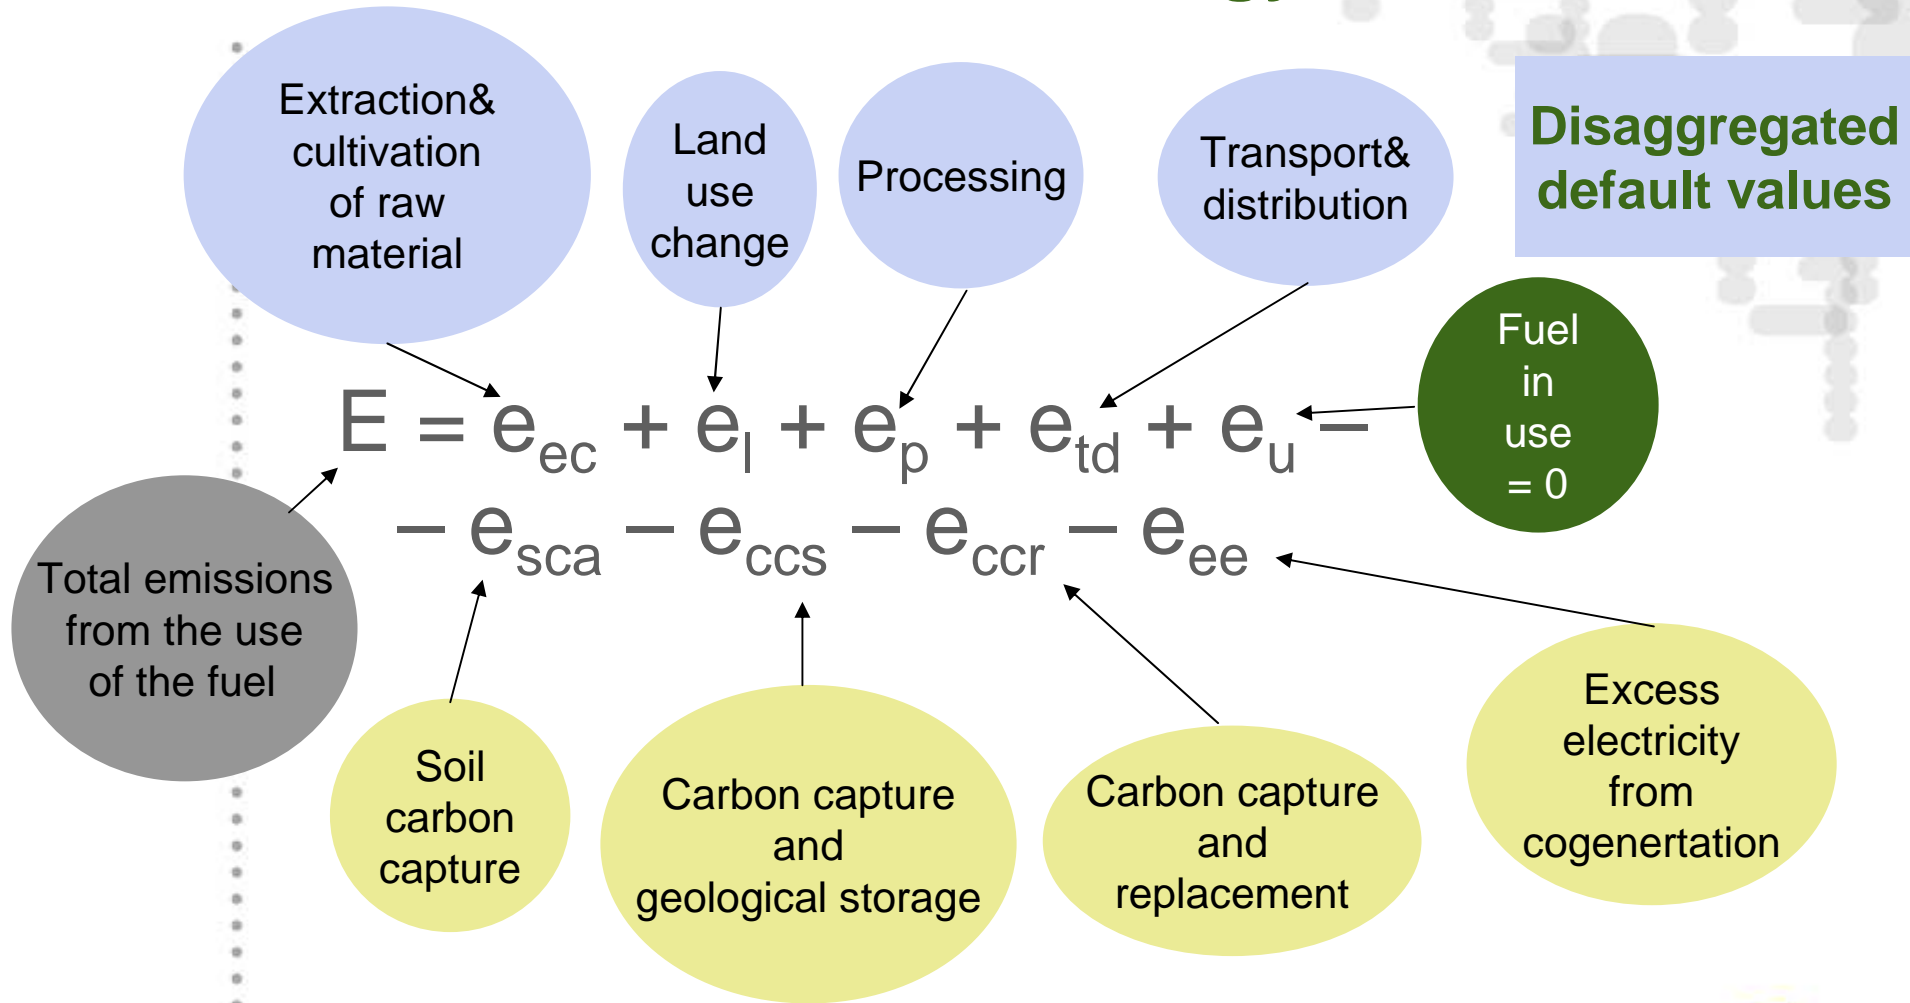

Biofuel production pathway	Typical greenhouse gas emission saving	Default greenhouse gas emission saving
– Ethanol from wheat (lignite CHP)	32%	16%
– Ethanol from wheat (process fuel not specified)	32%	16%
– Ethanol from wheat (natural gas steam boiler)	45%	34%
– Ethanol from wheat (natural gas CHP)	53%	47%
– Ethanol from wheat (straw CHP)		69%
– Ethanol from corn		49%
– Ethanol from sugar beet		52%
– Ethanol from sugarcane	71%	71%
– FAME from rape seed	45%	38%
– FAME from palm oil	36%	19%
– FAME from palm oil (methane capture)	62%	56%
– FAME from soy	40%	31%
– FAME from sunflower	58%	51%
– FAME from used cooking oil	88%	83%
– PVO from rape seed	45%	57%
– HVO from rape seed	51%	47%
– HVO from palm oil	40%	26%
– HVO from palm oil (methane capture)	68%	65%
– HVO from sunflower	65%	62%
– Biogas from dry manure	86%	82%
– Biogas from wet manure	84%	81%
– Biogas from MSW	80%	73%

Rape seed biodiesel
Default value: 38%

Ethanol from corn
Default value: 49%

RED Annex V.c: Methodology

**Disaggregated
default values**

Why harmonisation of biofuel GHG calculations?

EXAMPLE: Different results from same biofuel
 (“cherry picking” of the most beneficial standard values)

Parameter	Unit	Source			
		<u>EC (RED Annex V)</u>	<u>Netherlands (Ecofys / CE)</u>	<u>UK RFA</u>	<u>Germany IFEU</u>
Nitrogen Fertilizer	g CO _{2eq} /kg	5917,2	6367,0	6800,0	6410
P fertilizer	g CO _{2eq} /kg	1013,5	700,0	354 for TSP, 95 for rock phosphate, 596 for MAP	1180
K fertilizer	g CO _{2eq} /kg	579,2	453,0	333,0	663
CaO fertilizer (85%CaCO ₃ +15%CaO,Ca(OH) ₂)	g CO _{2eq} /kg	130,0	179,0	124,0	297
Pesticides	g CO _{2eq} /kg	11025,7	17256,8	17300,0	1240
Diesel (direct plus indirect emissions)	g CO _{2eq} /MJ	87,6	76,7	86,4	89,1
Natural gas (direct plus indirect emissions)	g CO _{2eq} /MJ	68,0	53,9	62,0	62,8
Methanol (direct plus indirect emissions)	g CO _{2eq} /MJ	98,1	137,5	138,5	62,5

Why harmonisation of biofuel GHG calculations?

EXAMPLE: Different results from same biofuel
(same input values but different standard values)

Production of FAME from Rapeseed

Production of FAME from Rapeseed

Overview Results

All results in g CO _{2,eq} / MJ _{FAME}	Total	Default values RED Annex V.D

Condensed list of standard values, version 3 - Public

This file gives the standard values as published on www.biograce.net in Word format.

Two Word versions of this list exist:

1. A complete list of standard values, containing all the values as listed in the Excel version
2. A condensed list showing the most important standard values

This file contains the condensed list.

Abbreviations and definitions used can be found in the Excel file on the web page

<http://www.biograce.net/content/ghgcalculationtools/standardvalues>.

1 Global Warming potentials

CO ₂	1	g CO _{2,eq} / g CO ₂
CH ₄	23	g CO _{2,eq} / g CH ₄
N ₂ O	296	g CO _{2,eq} / g N ₂ O

2 GHG emission coefficients

N-fertiliser	5880,6	g CO _{2,eq} /kg N
P ₂ O ₅ -fertiliser	1010,7	g CO _{2,eq} /kg P ₂ O ₅
K ₂ O-fertiliser	576,1	g CO _{2,eq} /kg K ₂ O
CaO-fertiliser	129,5	g CO _{2,eq} /kg CaO

Both Excel and Word versions available at www.BioGrace.net

Achievements

- European Commission makes reference to list
- 5 Member States make reference:
 - Denmark, Netherlands, Slovakia, Spain, UK
- Another 4 MS committed to do so
- One voluntary scheme makes reference
- 4 national calculators harmonised
 - Germany, Netherlands, Spain, UK
- Follow up project BioGrace II (solid&gaseous biomass) already under final negotiation

- Voluntary scheme: approval expected in the coming months

Contents

1. Renewable Energy Directive
2. Project BioGrace
3. BioGrace as voluntary scheme
4. GHG Excel tool – incl. the calculation example
5. GHG Excel tool – additional items
6. Conclusion

BioGrace as a voluntary certification scheme

- BioGrace voluntary scheme will consist of a zip file with
 1. BioGrace Excel GHG tool
 2. BioGrace calculation rules
 3. BioGrace user manual
- BioGrace scheme does not contain requirements on audits and mass balance
- GHG tool can be used as “add-on” to existing schemes
 - BioGrace has to be used together with another scheme

BioGrace has submitted GHG tool to EC for recognition as a voluntary scheme in May 2011; 21st in the queue

BioGrace as an add on to existing voluntary schemes

- Current voluntary cert. schemes
 - ISSC -> already refers to BioGrace
 - RTRS, 2BSvs -> allow for external calculator
 - Bonsucro, Greenergy -> only sugar cane, do not require GHG calculations
 - RSBA (Abengoa) -> company run; no calculator
 - RSB -> own database: ecoinvent

6 ISCC list of emission factors

The choice of emission factors has an impact on the results of the GHG emissions calculation. In the framework of the Directive 2009/28/EC there is no official list of emission factors available which must be used. Consistent literature on emission factors is limited, the variance of individual factors may be large and for some inputs emission factors might not be available at all or just an approximation can be used. However, to avoid cherry picking and to assure that GHG emissions calculation and audit takes place on an objective, transparent and verifiable basis, ISCC has developed a list of emission factors. This list covers the most relevant emission factors. It should be used for all GHG emissions calculation and audits within the ISCC System. The list was developed based on experience from a two year ISCC pilot phase and from the operational phase in 2010. **The list draws wherever possible from the BioGrace project.** Where no values are available from BioGrace other commonly accepted databases have been used.

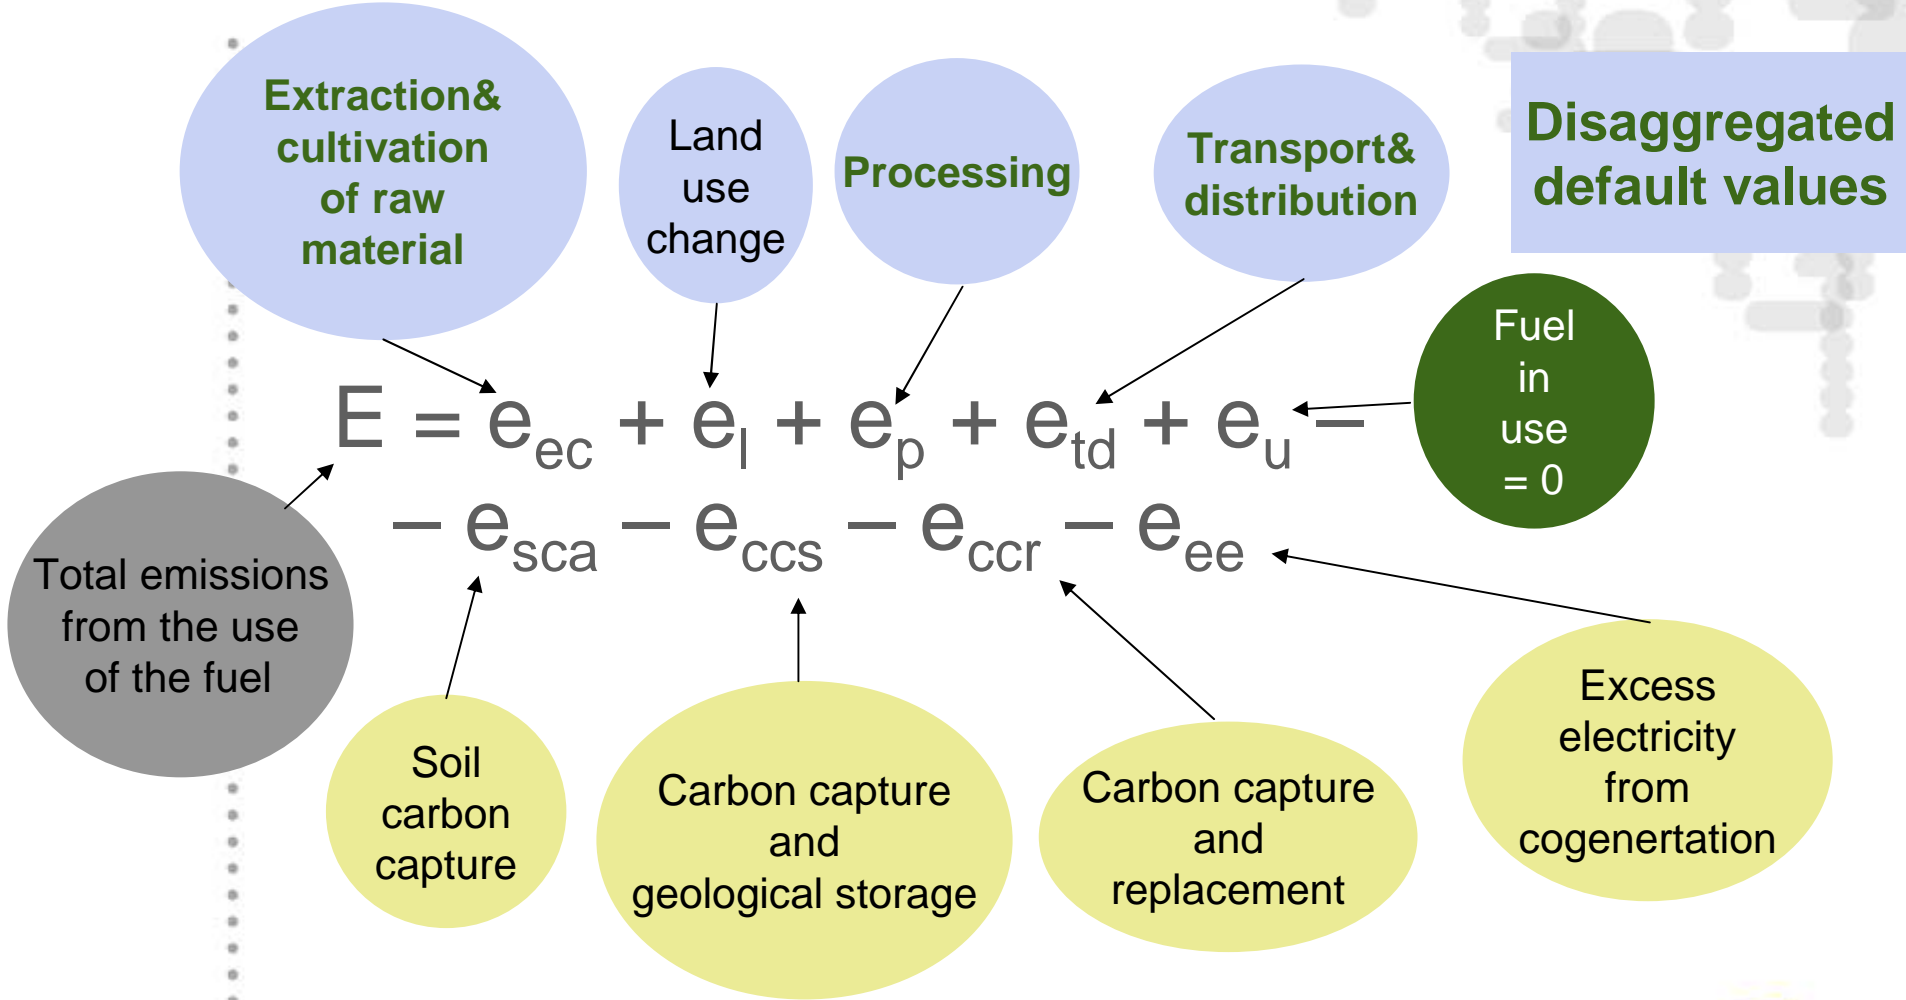

The ISCC list of emission factors can be supplemented and/or amended. Any ISCC Member, client or certification body can submit a new value or an update for an existing value. This proposal should be submitted to ISCC for verification and approval together with a rationale of why the value should be used. Whenever a new list of emission factors is published it will be distributed via the usual channels (email, ISCC Homepage) to ISCC Members, clients and certification bodies.

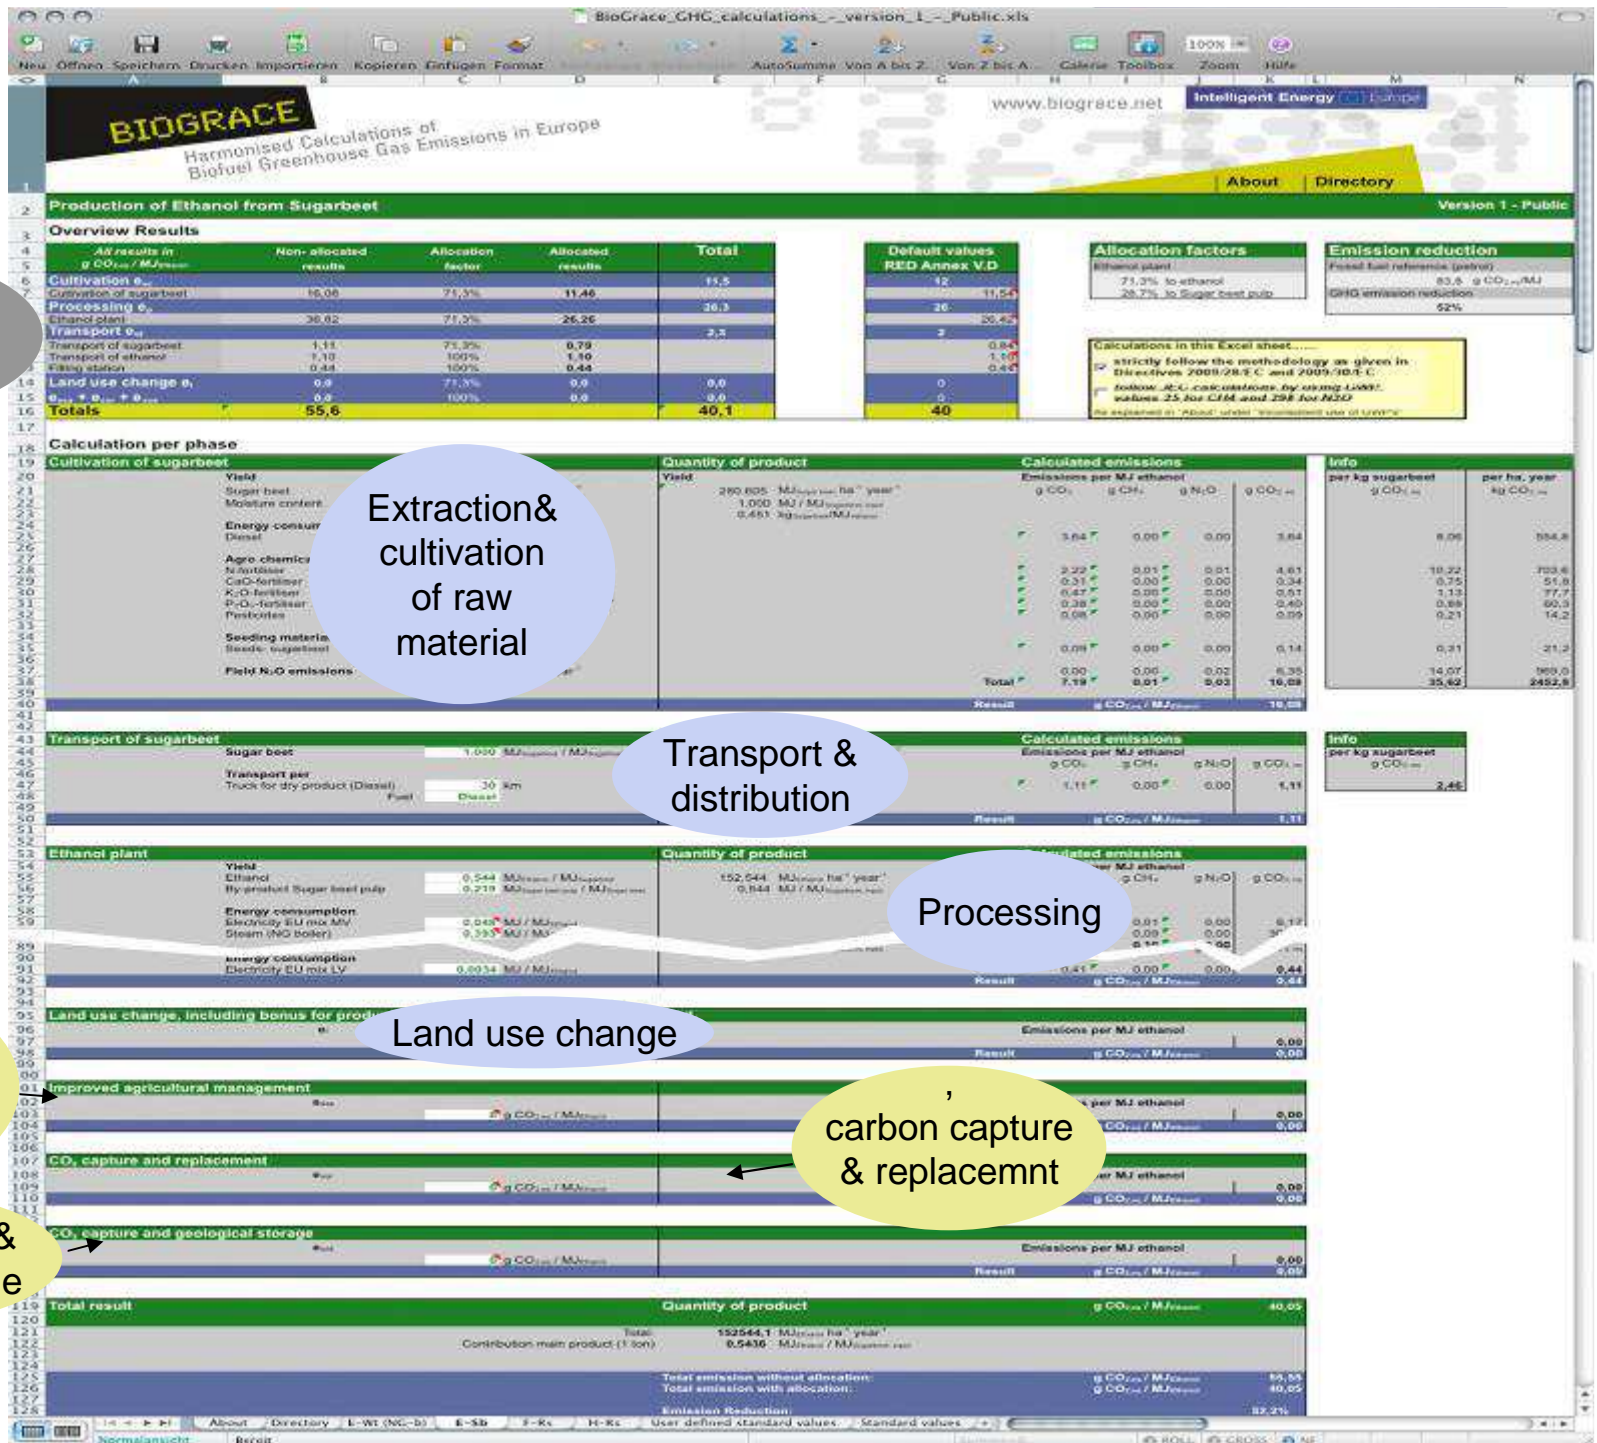

Contents

1. Renewable Energy Directive
2. Project BioGrace
3. BioGrace as voluntary scheme
4. GHG Excel tool – incl. the calculation example
5. GHG Excel tool – additional items
6. Conclusion

RED Annex V.c: Methodology

Disaggregated default values

Total results

Extraction & cultivation of raw material

Transport & distribution

Processing

Land use change

Soil carbon capture

carbon capture & replacement

Carbon capture & geological storage

The Excel tool

Before starting...

Take a look at

- the BioGrace calculation rules
- the BioGrace user manual
- the BioGrace additional list of standard values

BioGrace Calculation rules...

- define e.g.:
 - Which input data and standard values are allowed
 - Cut-off criterion
 - Combination of actual and disaggregated values
- are more detailed than methodology in RED Annex V.C

One important rule:

“Use “track changes” for verification purposes”

Production of Ethanol from Sugarbeet (steam from NG boiler)

Version 4 - Public

Overview Results

2. Use individual input numbers
3. Navigate through tool
4. Standard values
5. Define own standard values
6. Cut-off criterion

Demonstrated in the Excel tool

Calculation of N₂O field emissions

1. A major contributors to GHG emissions of most of the pathways
2. Default value : N₂O emissions calculated from a model (DNDC, average EU), except some pathways (IPCC Tier 1 for soybeans, palm trees, sugarcane)
3. For new pathways or when modifying the cultivation data from an existing pathways : BioGrace recommends to use IPCC Tier 1 estimation for this emission
 - Must be used for actual calculation

N₂O emissions : fill in few input data

	A	B	C	D	E	F
Calculation of N2O emissions using the IPCC methodology						
This sheet calculates the emissions of N2O from the cultivation of the crop						
The calculations make use of IPCC methodology Tier 1 on the estimation of N ₂ O emissions from managed soils (1).						
For some crops (soybeans, sugarcane and palm trees) the additional hypothesis used in JEC calculations have been incorporated						
In the case of soybeans, the nitrogen content of below ground biomass was considered to be 0.074 kg N/(kg dry matter) instead of 0.036						
In the case of sugar cane, N of above ground residues are not calculated using the IPCC methods. Alternatively additions of 0.01 t N/ha are considered						
In the case of palm trees, N of above ground residues are calculated by the JEC considering that 0.22 t dry residues are retained per t of fresh matter						
(1) IPCC 2006, 2006 IPCC Guidelines for National Greenhouse Gas Inventories, Prepared by the National Greenhouse Gas Inventory Team						
Crop data.						
Please enter the data for your crop in the blue cells						
Crop name		Sugar cane				
Crop yield (fresh matter)		1000	kg _{fm} /ha			
Humidity(%)		45.0%				
Crop yield (dry matter)		550	kg _{dm} /ha			
Straw yield (removed from the field)			kg _{dm} /ha			
Amount of vinnasse applied to the field (by default 0.94)			kg of vinnasse dry / kg sugar cane _{fm}			
Amount of filter cake applied to the field (by default 0.01)			kg of filter cake dry / kg sugar cane _{fm}			
N content of vinnasse applied to the field (by default 0.36)			kg N / t vinnasse			
N content of filter cake applied to the field (by default 12.5)			kg N / t filter cake			
Carbon loss due to land use change		0	t/ha			
Is the crop irrigated OR is rainfall in rainy season minus potential evaporation higher than soil water holding capacity?		1	yes=1; no=0

6. Conclusion

GHG Excel tool – additional items

1. Land use change
2. Improved agricultural management
3. CO₂ storage or replacement

Step 1 : declare LUC in your pathway

Zone nom	B	C	D	E	F	G	H
Yes	www.l						
Land use change, including bonus for production on non-agriculture or degraded land							
e _l Land use change				From : Warm temperature moist ; Native forest (>30 Europe ; High activity clay ; No till ; No input			
Does land use change occur? <input type="text" value="yes"/>				To : Warm temperature moist ; Cultivated/cropland tillage ; High without manure			
Go to sheet 'LUC' to calculate the land use change				Emission g CO ₂ eq / MJ _{Ethanol} 470			
Resulting land use change 19,16 ton CO ₂ ha ⁻¹ year ⁻¹							
Bonus (eB) <input type="text" value="0"/> g CO _{2,eq} / MJ _{Ethanol}							
							Result

Does land use change occur?

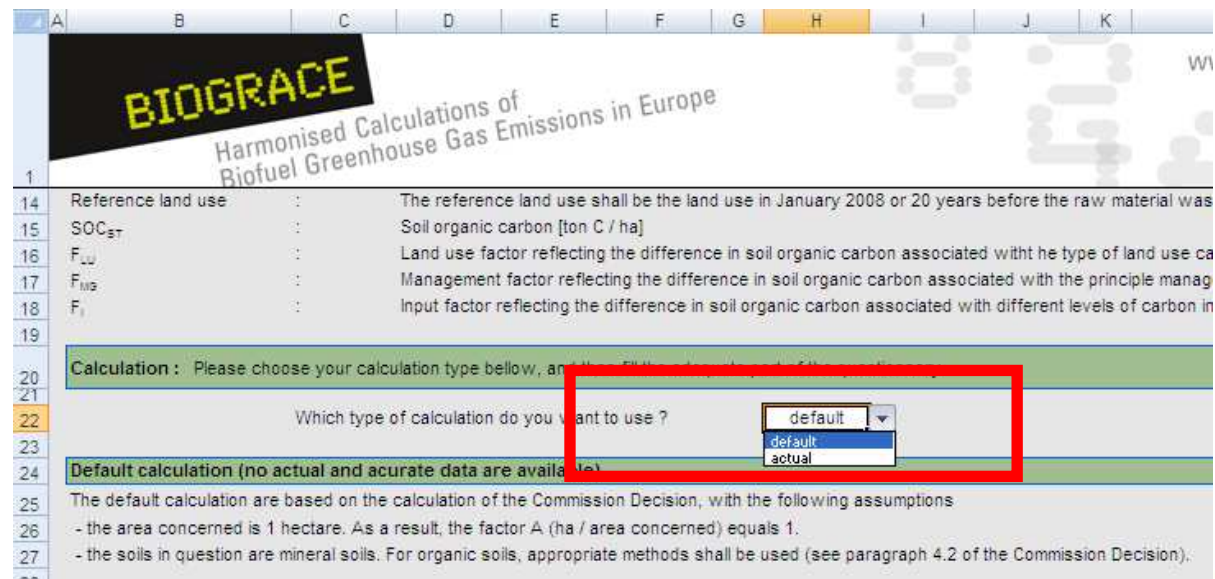

Resulting land use change 19,16 ton CO₂ ha⁻¹ year⁻¹
Bonus (eB) g CO_{2,eq} / MJ_{Ethanol}

From : Warm temperature moist ; Native forest (>30 Europe ; High activity clay ; No till ; No input
To : Warm temperature moist ; Cultivated/cropland tillage ; High without manure
Emission g CO₂ eq / MJ_{Ethanol} 470

Text appear

Step 2 : Go to the LUC excel sheet and read through this sheet. Get the Commission Decision 2010/335/EU.

Step 3 : Choose the type of calculation : default or actual and fill in the appropriate white cells.

Step 4 (default calculation) : use EC decision to fill out data

29 CS_A and CS_R are calculated with the following equation: $CS_i = C_{VEG} + SOC_{EST} * F_{LU} * F_{IIO} * F_i$

1. Renewable Energy Directive
2. Project BioGrace
3. BioGrace as voluntary scheme
4. GHG Excel tool – incl. the calculation example
5. GHG Excel tool – additional items
6. Conclusion

The complete Excel tool

- One separate worksheet for each of the 22 biofuel pathways
- Standard values worksheet
- Separate worksheet for user defined standard values
- Extra worksheets for calculation of
 - direct land use change (based on Commission Decision)
 - carbon stock accumulation thanks to improved agricultural management (based on Commission Decision)
 - N₂O emissions (based on IPCC Tier 1)
- List of additional standard values
- User manual
- Calculations rules

Questions ?

Final remarks

- Version 5 will show new pathways according to the RED Annex V update; spring 2012
- BioGrace is not a certifier! We provide the calculation tool and will maintain it but we do not
 - help individual stakeholders make actual calculations
 - check actual calculations at the request of stakeholders
- BioGrace will offer further workshops for trainers of verifiers
- BioGrace II: Tool for use of solid and gaseous biomass in electricity, heating and cooling; start up spring 2012
